**INTRODUCTION**

Helochelydrids belong to stem Testudines and were present in North America and in Europe since the Tithonian and up to the Maastrichtian. *Naomichelys speciosa* HAY 1908 is the only known helochelydrid species present in North America, and it has been recognized in different localities ranging from the Aptian to the Campanian (Joyce et al. 2011). Its skeletal anatomy has been studied by Joyce et al. (2014) and Lautenschlager et al. (2018). The endocasts of the brain, cranial nerves and blood vessels, and the inner ear have been reconstructed and described in detail based on µCT-data (see Table 1 and Fig. 1) (Paulina-Carabajal et al. 2019). *N. speciosa* was a terrestrial turtle characterized by a large olfactory region suggesting that olfaction was an important sense of this species.

**METHODS**

The 3D surfaces were extracted semi-automatically within MIMICS 18.0 using the segmentation threshold selection tool. The 3D surface models are provided in .ply format, and can therefore be opened with a wide range of freeware.

**BIBLIOGRAPHY**

Figure 1. Skull and endocasts of the stem turtle *Naomichelys speciosa* (FMNH PR273; Field Museum of Natural History, Chicago, USA) in A) oblique anterodorsal, B) anterolateral, C) ventral, D) dorsal, E) anterior, and F) posterior view. Skull transparent. Blue, endocast of the brain, cranial nerves, and nasal cavity; red, blood vessel endocasts; green, endocast of the cavum acustico-jugulare; pink, cast of inner ear; yellow. Skull length: 129 mm.
