Abstract

This contribution contains the 3D models described and figured in the following publication: Paulina-Carabajal, A., Nieto, M.N. In Press. Brief comment on the brain and inner ear of *Giganotosaurus carolinii* (Dinosauria: Theropoda) based on CT scans. *Ameghiniana*. <https://doi.org/10.5710/AMGH.25.10.2019.3237>

Keywords: Carcharodontosauridae, Cranial Endocast, CT scans, Endosseous Labyrinth, Paleoneurology

Submitted: 2019-12-10, published online: 2020-04-01. <https://doi.org/10.18563/journal.m3.108>

INTRODUCTION

The neuroanatomy of Carcharodontosaurinae (sensu Novas et al., 2013) theropods, is known for only two taxa (and two specimens): *Carcharodontosaurus saharicus* (Depéret and Savorin 1925) from the Upper Cretaceous of Africa, and *Giganotosaurus carolinii* (Coria and Salgado 1995) from the Upper Cretaceous of South America. The endocranial cavity of the type braincase of *G. carolinii* was emptied of sediment and a latex endocast was made (Paulina-Carabajal and Canale, 2010). The latter lacked certain structures since their osseous correlates were still infilled with sediment or broken. A recently made CT scan of the braincase of *G. carolinii* allowed the digital reconstruction of a more complete cranial endocast, plus the first reconstruction of the inner ear for this taxon (see Fig. 1 and table 1). As a result, a most accurate identification of the neurovascular cranial foramina of the braincase, formerly described by Coria and Currie (2002) and Paulina-Carabajal (2009), was made (Paulina-Carabajal and Nieto, in press).

METHODS

The 3D surfaces were extracted semi-automatically within MIMICS 18.0 using the segmentation threshold selection tool. The 3D surface models are provided in .ply format, and can therefore be opened with a wide range of freeware.
