Abstract

This contribution contains the 3D models described and figured in the following publication: Mennecart B., de Perthuis Ad., Rössner G.E., Guzmán J.A., de Perthuis Au., Costeur L. The first French tragulid skull (Mammalia, Ruminantia, Tragulidae) and associated tragulid remains from the Middle Miocene of Contres (Loir-et-Cher, France). Comptes Rendus Palévol. <https://doi.org/10.1016/j.crpv.2017.08.004>

Keywords: comparative anatomy, CT-scan, ear region, MN5, systematics

Table 1. Information related to the 3D model, a fragmented skull with well-preserved basicranial areas. The 3D surface files of the specimen AP2014.0715 (digital copy NMB Fa.213.abg) are the reconstructions of the main skull fragments, the right petrosal bone, and the left bony labyrinth.

INTRODUCTION

We report the first skull of tragulid from France (see Fig. 1, Mennecart et al. 2017). The ear region is well-preserved. Thus, comparisons of this area are done with other living and extinct ruminants. Mennecart & Costeur (2016a, b, c) already published in detail bony labyrinths and petrosal bones of living and fossil tragulid. Mennecart & Costeur (2016b) and Mennecart et al. (2016) highlighted the importance of this structure in phylogenetic analyses, at least in ruminants. Here we confirm that the petrosal bone described in Mennecart & Costeur (2016b, c) belongs to *Dorcatherium crassum* and that the ear region can be used for taxonomic purposes.

METHODS

The 3D surfaces were extracted within AVIZO 9 Lite (Thermo Fisher Scientific) using the segmentation threshold selection tool. The 3D surface models are provided in .ply format, and can therefore be opened with a wide range of freeware.
